

TASKS

Imagine you are responsible for testing a web application. Your team is preparing a release of a new feature. Just before the release you spot a bug. What next steps you would take to resolve the situation. Take into consideration different scenarios and circumstances.

It's not an easy situation nor for development team nor for the client. However we have some options to choose.

1. The most honest is to talk to the customer about the bug and let them decide how they want to proceed.
2. We can decide on behalf of the client and delay the delivery until the bug is fixed. But we have to remember that it is possible that failure to meet the deadline will result in the need to pay contractual penalties.
3. We can also hide the bug and hope that the customer does not find it before we can deliver a fix. It seems to me as the worst solution.
